Electrical conductivity of “liquid crystal – $\text{Cu}_6\text{PS}_5\text{I}$ superionic nanoparticles” composites

Mashiko V.V., *Student*; Studenyak I.P., *Professor*
Uzhhorod National University, Uzhhorod

One of the promising methods to extend the liquid crystal (LC) functionality is introduction of the nanoparticles. Thus, nanoparticles of superionic conductors with argyrodite structure, in particular $\text{Cu}_6\text{PS}_5\text{I}$, can help to extend functional properties of LC. They are characterized by high electrical conductivity as well as ferroelastic and nonlinear optical properties. Therefore, the aim of this work was to study the influence of $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles on the electrical conductivity of 6CB and 6CHBT liquid crystals.

6CB and 6CHBT liquid crystals without/with $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles was studied in a sandwich-type cell with transparent ITO electrodes. The electrodes were coated with an appropriately processed polymer layer to provide the planar orientation of the LC molecules. The concentration of nanoparticles of a near-spherical shape with the average size of 35 nm in the liquid crystals was 0.01, 0.05, and 0.1 mg/ml. The cell thickness was 10 μm . The LC cell was filled using the capillary method at a temperature by 5–10 K above the nematic-to-isotropic phase transition temperature. The dielectric properties of the prepared sandwich cells were studied in the frequency range 10–10⁶ Hz at 293 K using the oscilloscopic technique.

It is shown that unlike 6CHBT LC with $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles the electrical conductivity of 6CB LC with $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles is a monotonic function of nanoparticles concentration. Moreover the conductivity of 6CB LC with $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles is much higher than the conductivity of 6CHBT LC at the same concentration of nanoparticles (the maximum value of these conductivity ratios is close to 50 at a concentration of $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles equal to 0.05 mg/ml). The main reason for such effects is the generation of ions, additional to existing in 6CHBT LC. The existence of additional ions in 6CB LC is confirmed by the presence of two "plateaus" on the frequency dependence of conductivity, which the most typically appear at 0.05 and 0.1 mg/ml concentrations of $\text{Cu}_6\text{PS}_5\text{I}$ nanoparticles.
