PHYSICALITY HUMAN AS A PHENOMENON OF PHYSICAL EDUCATION (metodološko-synergy analysis)

Voznyy A. P., PhD, Associate Professor
Medical Institute of SSU
kfv@sport.sumdu.edu.ua

Philosophical Discourse "body" as an inherent part of the "human" lasts forever and has many interpretations, written in the socio-cultural context. Many explications "flesh" forms in the modern field of philosophical research a variety of approaches, paradigms and perspectives. In scientific research are theoretical generalization and new solution to the problem of human physicality, as the phenomenon of physical culture.

1. An important methodological principle research value of human physicality and physical training is the use of multi-dimensional approach: a) physicality - a substrate of human activity, which is a multidimensional entity that exists in three dimensions: biological (natural) body, physicality internal, external physicality and constructed at their intersection; b) physicality, in our opinion - is a set of information, energy, system-structural and functional properties that include every single human biological systems; c) a person in its main essential characteristics - body-social education. Phenomenon is the fact that the actual physicality carries important implications for the structure of physical culture and ensure its existence and development.

2. Physical education - is an organic part of the culture of human society, the totality of his achievements in the creation and sustainable use of special tools, methods and conditions of directed physical development of the person: a) In our view, physical culture a set of conscious biological, psychological, social and spiritual factors for the development of the human body. It is the main means of increasing social activity of the individual, influence the development of culture in general; b) physical activity – a conscious human activity, social groups and society to improve physical, spiritual and mental qualities by natural, social and cultural

factors;c) physical education is a complex and multi phenomenon of social life. Synergetic vision among international sports movement peredumovlyuye rational understanding its meaning and role in the value system of physical culture in terms of the most common mechanisms of self-understanding for major developments.

3. Synergetics - a new dialogue with nature, a new synthesis of human knowledge and wisdom. Synergetics - a new approach to the knowledge of evolutionary processes, instability and chaos. Synergetics - a new approach to mastering the methods of nonlinear control of complex systems that are in a state of disequilibrium and which is primarily a natural man.

4. Research interdisciplinary Bioethics revealed that it is a specific part of the work of biology, philosophy, ethics, and law. Modern bioethics claimed as vital condition for the functioning humanistic indicative of scientific knowledge in the field of living matter and alternatives that exist for either science or for humanity, but science can not be regulated only by ethical level, its ability to moral self-control does not solve anything. Confine the moral and personal circumstances

5. Man a creature that is able and define the boundaries and take any of their definitions, as the certainty of rights, among other things, depends on his will, which means that any of certainty is not an end. Over time, it can be canceled subject will. The will of man is capable of converting any human certainty in uncertainty. Human existence in the world thus appears as something diverse, uncertain, plastic, which allows conversion using humanotehnolohiy.
