

# THE IMPACT OF STRATEGIC ANNOUNCEMENTS ON CORPORATE VALUE: AN EVENT STUDY OF NETBANK INC.

Priscilla Liang\*, Mo Vaziri\*\*

## Abstract

This paper applies event study methodology to analyze the impact of strategic announcements on the value of NetBank Inc., the world's largest purely online banking institution. Strategies analyzed in the paper are promotions and promotional alliances, new services/products, services/technology improvements, and partnerships and acquisitions. Empirical results conclude that strategies such as introducing new services/products, partnerships and promotional activities, especially promotional alliances, decrease NetBank's value. Conversely, services and technological improvement that provide convenience to customers and reduce corporate costs increase NetBank's value. Also, activity such as acquiring a competitor's existing customer base increases NetBank's value. But diversification through acquisition should be avoided. Testing results can apply to other Internet companies or companies in high tech industries.

**Key words:** Corporate Valuation, Event Study.

**JEL classification:** G, G14,

## I. Introduction

It has been long maintained that investors' perceptions about a company's future earnings determine its stock price. Information released from the company on which investors form their beliefs therefore is crucial for market valuation. This study intends to investigate the impact of strategic activities on a firm's value. Evans and Wurster (1997) argue that the world is in the midst of a fundamental shift in the economics of information. They contend major changes will occur in the structure of entire industries and in the ways companies compete. Internet banking, for example, is a pioneer in the e-commerce environment, and this case study will focus on NetBank Inc., the sole survivor among totally online banks.

### *A. Historical Background of NetBank*

NetBank, initially known as Atlantic Internet Bank, was founded as an internet-only bank in October 1996. It went public in July 1997. The bank made its first annual profit in 1998, making it the first profitable independent Internet bank in the country, serving customers in all 50 states and 20 foreign countries. The bank started out serving as a depository institution for consumers and buying certain loan assets from third parties. In time, the company realized it was going to take longer to reach a critical mass of lending over the Internet than it took to acquire deposits over the Internet. In summer 2001, the company made a move to change its strategy to acquire two big non-internet mortgage-banking companies. The bank acquired Market Street Mortgage, a retail mortgage lender based in Clearwater, Florida, and licensed to conduct business in 37 states. NetBank acquired Resource Branchshare Mortgage Group, Inc., a wholesale mortgage banking company focused on purchase, sales and service of residential, single-family first mortgage loans through a nationwide network of independent brokers and correspondent banks. Other than acquiring mortgage companies, the bank secured CompuBank's deposit accounts in 2001 and Netinsurance.com in 2002. The acquisitions strategy would build the asset side of the bank's balance sheet to create greater value for the firm's shareholders.

---

\* California State Polytechnic University, Pomona, USA.

\*\* California State University, San Bernardino, USA.

NetBank's branchless business model theoretically enabled it to run at a cost structure much lower than brick and mortar banks, hence passing the benefits to customers by offering free checking to all of its NetValue Checking Account customers, free unlimited online bill payment, unlimited online bill payment, unlimited ATM use, unlimited check writing and free checks. Over time the bank had introduced new services within insurance, auto lending, wealth management products, and small business products.

NetBank has upgraded its banking technology platform to better accommodate future growth and offer customers a wider range of new and improved services. During 1999, the bank completed multiple technology upgrades to its online banking platform to increase the reliability and speed of the service. In 2002, the bank enhanced its electronic customer relationship management (eCRM) system through a business partnership with WebTone Technologies, a leading touch-point management company that produces customer interaction solutions that enable financial institutions to maximize operating efficiencies and minimize costs.

In its early efforts to improve its marketing efficiency, the bank relied on online banner ads, formed strategic marketing partnerships with groups like American Online (AOL), Microsoft, Six Continents Hotels, Federated Department Stores and Tupperware. The programs were structured as pay-for-performance and required the bank to pay a fee only for new, funded accounts that it received.

NetBank went public in July 1997 at \$11 per share, and at its peak in April 1999 it was valued at 21.35 times its closing price on the IPO date. But by the end of 2000, the market value declined to 1.74 times its initial level. The bank's value has remained below 5 times its initial price since the beginning of 2000 (See Figure 1).

(Note that NetBank's stock prices vary greatly in daily basis compared to those of S&P 500 Index. Prices have increased dramatically during stock split period.)

Fig. 1. Adjusted daily closing prices for NetBank Inc. and the S&P 500 Index

In order for the bank to increase its value, several strategies have been applied. However, it is not clear which of the strategies significantly contributed to the value of the bank. Is NetBank strategically different from other online banking firms? Do investors perceive NetBank's different type of strategic announcements differently from other firms? And what might we learn from NetBank's survival?

## II. Theory and Hypotheses

The general strategy of online companies is to increase sales through increased web traffic. For an Internet bank, the same assumption applies. Internet banks will try different strategies to increase web traffic, thus to increase its customer base via sales.

### *A. Promotion and Promotional Alliances*

Promotional activities, especially those in the early period of the firm's life, have become more important in today's dynamic e-business environment. Promotions can help more consumers become aware of the firm's products and services. On the other hand, they can be very expensive and ineffective. Porter (2001) maintains that e-businesses frequently have chased customers indiscriminately via discounting, channel incentives and advertising, seemingly more interested in click-through revenues and an overload of extra services rather than the bottom line. Filson (2004) suggests that the marginal benefit of promotional activities may fall over time and investing in promotional activities has diminishing marginal returns.

Additions may add to Filson's analysis. Since consumers cannot observe the physical appearance of an online company, reputation and trust become more important. For a start-up online firm, promotions or referrals through some reputable alliances may help the company gain the reputation and trust it needs. This prompts hypothesis 1.

***Hypothesis 1:** Promotional events in general will increase the value of the firm. Promotion through cooperative alliances with leading corporations will have a more positive impact on the firm's value than promotion without alliances. Promotional events have diminishing marginal returns: early promotions in the firm's life have a more positive impact on the firm's value than those later on, it is herein assumed.*

### *B. New Services/Products*

Strategy is the way in which a company orients itself toward its market and its competitors. It is a plan and organization formulates to gain sustainable advantages over that competition. The E-commerce environment is dynamic and fast moving. The company must reassess continuously to catch that competitive advantage. One strategy is to continuously offer new services and products. During the process of doing so, managers should ask themselves, "What are the sources of the company's competitive advantage? How will the company position itself against competition? What kind of new products will warrant and secure the company's competitive advantages?" Since the answers are largely unknown, product innovation is a "trial and error" process. If the firm finds some of the answers later on, the further introduction of new products will tend to help it to capture a market niche. High uncertainty of new services and products introduction suggest the next hypothesis

***Hypothesis 2:** New services/products reduce the firm's value. The new services/products introduced later in firm's life will have positive impact on firm's value due to the learning process.*

### *C. Services/Technology Improvements*

Web traffic is important for an online company. But due to absence of location advantages, firms can gain and lose customers easily. Many online firms realize the importance of better service as part of a package of customer retention. Customers may try online services for different reasons, but what makes them stay online are convenience, easy access, high security and superior customer services. Customer retention, not acquisition, is a more profitable channel for a financial service firm. Technology improvement will warrant service improvement and further reduce operational costs, thus allowing online companies to pass on the savings to their consumers – a critical survival step. In sum, the benefit of services/technology improvement is customer retention and cost reduction. Such strategy at the initial stage will greatly improve the quality of customer

service. Later, costs are relatively constant but the marginal benefit tends to decrease. While competitors catch up with similar technology, marginal costs will eventually outweigh the marginal benefit. This leads to hypothesis 3.

***Hypothesis 3:** Investment in services/technology improvement has diminishing marginal returns: investments early in the firm's life have a more positive impact on the firm's value than those later on.*

#### **D. Alliances**

In e-commerce, strategic alliances enable firms to gain a competitive advantage through access to a partner's resources, including market, technology, capital and human. The prevailing business practice is: focus on what you do best, strive for excellence in a few key areas, and tap into the resources of others for the rest. Therefore, you can achieve the 80/20 principle rule: 80% of profits come from 20% of the efforts. A firm will be more selective in forming alliances later in its life due to increasing experiences, which leads to hypothesis 4:

***Hypothesis 4:** Alliances add value to the firm. Forming alliances later in the firm's life have a more positive impact on the firm's value than those early on.*

#### **E. Acquisition**

Acquisition is a major strategy tool for fast-track technology-led companies. Acquisition can help a company to acquire complementary products to broaden the line, to acquire new markets or distribution channels, to acquire additional mass, and benefit from economies of scale; and to acquire technology to complement or replace the currently used one. For most banks, traditional or online, they achieve their growth through acquisitions. It is cheaper to acquire an existing customer base than to lure new ones through expensive marketing. This suggests hypothesis 5.

***Hypothesis 5:** Acquisitions increase the firm's value.*

### **III. Methodology**

The authors employed press releases from *Business Wire* and *PR Newswire* in the *Lexis-Nexis* database, and NetBank's websites to assemble a comprehensive list of important announcements of strategies. Based on our hypotheses, we selected announcements that are categorized as promotion and promotional alliances, new services and new products, services and technology improvements, alliances and acquisitions. Because financial announcements have significant impact on the firm value (MacKinlay, 1997), as control variables, also included were all important financial announcements, such as announcements of quarterly financial results, stock splits, dividend issues, debt and equity issues and any other finance related information. When multiple announcements occur on the same day or on adjacent days, we count only one event and put the event date on the most important event's date. (It was assumed that financial announcements are more important than strategic announcements). Thus, during the period of examination there were 29 financial announcements, 28 promotion announcements, 24 announcements related to new products/services and 20 related to service/tech improvements. Only 5 acquisitions were noted.

We use adjusted daily closing prices to construct daily return series for as long as the firm was publicly traded prior to October 14, 2003. The S&P 500 index was used to construct market returns. The series are from Yahoo! Finance and Moneycentral.msn.com. The unconditional standard deviation of NetBank's return is 5%, which is much higher than 1.3%, the unconditional standard deviation of S&P 500's return. This implies that daily returns of plus or minus 5% are well within the range of ordinary fluctuations and returns must be plus or minus at least 10% in order to be in the tails of the distribution. Partly because of this, some of the estimated effects reported are statistically insignificant.

Typically, the event window is chosen to be larger than the specific period of interest. This allows information to leak out before the event occurs and also allows for lags in the reaction time of the

window. It is established that the market begins responding to announcements two days in advance, and the announcement typically appears in the Wall Street Journal the day after it is released. We use an event window that includes the two days prior to the announcement day and one day after:  $[-2, 1]$  to estimate the announcement effects. However, in order to test the robustness of the results, event windows  $[-1, 1]$  are also used during analysis.

Some of the event windows overlap because some announcements are made less than three days apart. To correct this problem, we used two methods to estimate the cumulative abnormal returns (CAR). In the first method (Filson 2004), we regress NetBank's daily returns on the market daily return and dummy variables, one for every event window. The estimation equation is

$$R_{it} = \alpha + \beta R_{mt} + \sum_{j=1}^J \gamma_j d_j + \varepsilon_t, \quad (1)$$

where  $R_{it}$  is NetBank's stock return on day  $t$ ,  $R_{mt}$  is the market return on day  $t$ ,  $J$  is the total number of events for firm  $i$ ,  $d_j$  is a dummy variable that takes the value one during event  $j$ 's event window,  $\varepsilon_t$  is the error term on date  $t$ , and  $\alpha$ ,  $\beta$ , and the  $\gamma_j$ 's are the estimated coefficients. In this method, the t test of the significance of event  $j$  uses the t statistic of  $\gamma_j$ . To avoid double counting abnormal returns when event windows overlap, we multiply  $\gamma_j$  by the length of the event window to compute the CAR of event  $j$ .

In the second method (MacKinlay, 1997) we delete periods covered by the event windows from the sample, estimate the market model by regressing  $R_{it}$  on  $R_{mt}$ , and compute the CAR of an event by summing the forecast errors during its event window. Regression results from both methods are reported in Table 1, and results are robust.

Table 1

Regression results

Net.B@nk(TM)	Method 1	Method 2
Constant Terms (Standard Error)	0.001863 (0.001375)	0.001890 (0.001317)
Beta (Standard Error)	1.242363 (0.090680)	1.157262 (0.097686)
R-squared	0.188	0.108
Adjusted R-squared	0.130	0.107
Number of Observations	1562	1160

## IV. Empirical Results

Table 2 summarizes the empirical results and appendices 1-5 describe the results in detail. Appendix 6 summarizes CAR from financial announcements.

### A. Promotion and Promotional Alliances

The empirical results for hypothesis 1 are mixed. First, promotional events have no significant impact on the firm's value. The summary CAR from Table 2 suggests that promotional events have a negative impact on the firm's value when evaluated using the  $[-2, 1]$  event window, but the CAR becomes positive while evaluated using the  $[-1, 1]$  event window. Since the Wald test sig-

nificance level is very low, such results can be contributed to daily price fluctuation or the estimation error.

Secondly, Table 2 offers an opposite result from the first hypothesis.

Table 2

## Summary effects of strategies using method 1

Table Entry is:

Cumulative Abnormal Returns

(Number of Events, Wald Test Statistic for Significance of Cumulative Abnormal Returns (1 degree of freedom))

Strategies	Event Window [-2,1]	Event Window [-1,1]
All Promotional Events	-0.1158 (26, 0.0528)	0.0125 (26, 0.0008)
Promotional Events without Alliances	0.0079 (11, 0.0006)	0.1708 (11, 0.3822)
Promotional Events with Alliances	-0.1237 (15, 0.1010)	-0.1582 (15, 0.2415)
Early Promotional Events	-0.0116 (15, 0.0010)	0.1517 (15, 0.2218)
Late Promotional Events	-0.1041 (11, 0.1030)	-0.1392 (11, 0.2540)
All New Services/Products	-1.150 ** (23, 6.146)	-0.5509 (23, 1.8740)
Early New Services/Products	-0.7018 ** (14, 3.9202)	-0.3211 (14, 1.0680)
Late New Services/Products	-0.4483 (9, 2.4331)	-0.2298 (9, 0.8602)

Early Services/Technology Improvements	0.1425 (7, 0.3224)	0.3237 (7, 2.2057)
Late Services/Technology Improvements	0.1429 (12, 0.1840)	0.2599 (12, 0.8111)
All Alliances Events	-0.9418 (37, 2.4133)	-0.4073 (37, 0.6171)
Early Alliances Events	-0.6843 * (17, 2.9507)	-0.3263 (17, 0.9019)
Late Alliances Events	-0.2576 (20, 0.3505)	-0.0810 (20, 0.0468)
Acquisition	0.0655 (5, 0.0958)	0.0442 (5, 0.0577)

\* Significant at the 10% level.

\*\* Significant at the 5% level.

\*\*\* Significant at the 1% level.

Promotions through alliances reduce the firm's value while promotions without alliances add value. Even though the statistical results are insignificant, further analysis is warranted. Appendix 1b suggests that advertisement alliances reduce value, but alliances with reputable firms, such as Ameritrade Corporation, Delta and United Air Lines, which offer reciprocal services between partners, increase the firm's value. This can be explained that opportunity costs of advertisement related alliances are determined by the partner's cost, while the firm can control opportunity costs in reciprocating services related alliances. Appendix 1a suggests that promotional announcements

(without alliances) related to service and technology improvement increase the firm's value. For example, the announcement of NetBank's launch of NetBank Financial Network (TM), a network which provides superior customer service and online portfolio personalization, added significant value to the firm (3/14/00).

Lastly, Table 2 supports a diminishing marginal return theory of the promotional activities. Statistical results from both estimation windows suggest that late promotional activities have negative impact on the firm's value. Estimation use [-2, 1] window suggests that promotion activities have negative impact on value in general. Negativity is persistent in both early and late periods. Later promotional activities have more negative impact on value than the early ones.

#### ***B. New Services/Products***

Table 2 supports hypothesis 2. CARs for all new products/services are negative at significant levels. But CARs for later events are less negative than the early ones. Appendix 2 provides detailed insights. For the first three years of NetBank, it offered many new services/products (mortgage application, stock quotation, leasing and brokerage services, online tax centers, safe deposit boxes). Many of these offers are unnecessary and unproductive. For the next three years, NetBank has a better defined goal. Instead of diversifying in every direction, it has clearly identified what business lines to keep and what to discard. "(We) decided that it did not want to be involved in commercial loans, commercial real estate, and riskier bank investments" announced NetBank CEO D.R. Freeman on August 8, 2002. The company intended to offer new products that fit into its long term goal, focusing on auto lending, mortgages, small business loans and others. Even though these efforts still negatively impact corporate value, the magnitude is reduced and is statistically insignificant. Analysis suggests that value of new products and services depends on the maturity and learning process of the company.

#### ***C. Services/Technology Improvements***

Table 2 provides weak support for hypothesis 3. Services/Products improvements have positive CARs. But CARs are not significantly different between the early and later periods. CARs for the two periods are almost the same by using the [-2, 1] event window, and the later period CARs is slightly lower by using the [-1, 1] event window.

Statistics in Appendix 3a show that some of the service improvement announcements have significant positive impact. For example, NetBank announced it would upgrade its banking technology platform to provide an updated look for the bank, easier navigation, and improved customer access to information (1/19/99). Investors embraced this news positively. NetBank has noticed the importance of service improvement, and offered similar acts later on. Appendix 3b suggests investors welcome announcements related to the technology improvements that will reduce costs, and services improvements that offer consumers convenience and easy use of the web. News related to innovation or initiations, even closely related to service and technology improvement, is not welcomed by investors. This is consistent with the finding in hypothesis 3.

#### ***D. Alliances***

Table 2 rejects hypothesis 4. Forming alliances reduces value in general. Alliances early in the firm's life have significant negative impact on value. Those formed late continue the negative pattern, although the impact is less negative and is insignificant.

The result is a surprise at first glance. But it is noteworthy that 27 out of 37 of the alliances announcements are related to promotion and new products/services initiation, which both have negative impact on value. The final results are still consistent with previous findings: alliances related to customer retention and cost reductions have no impact or positive but insignificant impact to the firm. Alliances related to new services and products have negative impact on the firm. Events that have negative CARs greater than 0.10 (greater than the standard deviation of the firm) include: stock quotation (11/28/97), safe deposit box (6/7/99), mortgage approval (11/13/00) and alliance failure with Priceline.com (10/9/00). Three out of the four are related to new product introduction.

One more finding worth mentioning: web-nonweb based alliances (alliances with MSN, Federated Department Stores, and six Continental Hotels) offer greater complementary resources and capabilities, therefore, perform better than web-web based alliances.

### *E. Acquisition*

Table 2 weakly supports hypothesis 5. CARs are positive using both event windows, but are statistically insignificant. Appendix 5 has provided mixed results. Acquisition related to acquire customer base or operational assets have positive impact on the firm, but acquisitions related to diversification, such as to acquire Financial Technologies, Inc, a leading provider of ATM service (10/06/03), have negative but insignificant impact on the firm value.

## **V. Summary**

Conclusions for NetBank are as follows: First, promotional activities, especially promotional alliances, should be avoided. Second, introduction of new services/products also should be avoided. Third, firms should consider services and technology improvement, therefore, to provide convenience to its customers and reduce firm costs. Fourth, business alliances should be avoided, especially those involved with promotion and products/service initiation activities. Fifth, acquisition activity such as acquiring another firm's existing customer base should be encouraged. But diversification through acquisition should be avoided. Only two out of the five categories have statistically significant results. Findings from NetBank's case are consistent with Johnson's (2003), that new product failure rates are very high, from 33% to 60% or higher. Promotions may negate gains. Booz, Allan and Hamilton (1971, 1980) report similar results as well.

In addition, there are some important statistical indicators for NetBank. Table 3 shows a comparison of NetBank's key ratios with those of its main competitors, Citigroup Inc and Wells Fargo & Co, and with those of the industry.

Some observations about the company's overall performance are as follows:

1. Investors have perceived NetBank as relatively risky. Its Beta is well above those of its competitors.

Table 3

### NetBank's Overall Performance

Comparison of Some of the Key Ratios and Statistics of NetBank, Wells Fargo, Citigroup and the Industry

	NetBank	Citigroup	Wells Fargo	Industry
Beta	2.203	1.475	0.368	--
CF from Operations	-1.39 billion	19.4 billion	-26.96 billion	--
Free Cash Flow	-1.42 billion	17.22 billion	--	--
Price/Earning	12.43	15.96	15.44	16.04
Sales (Growth rate %)	38.2	--	13.6	2.9
Net Profit Margin	10.4	16.7	19.8	18.8
5yr Net Profit Margin	-0.4	12.4	15.1	13
Debt/Equity Ratio	3.28	1.42	1.92	1.07
Return on Equity	12.6	16.8	18.8	15.1
EPS	1.086	2.983	3.563	1.44
Return on Capital	-0.1	6.9	6.4	5
Income/Employee	25,000	62,000	50,000	68,000
Revenue/Employee	239,000	373,000	255,000	362,000

Sources: Moneycentral.msn.com, October 24, 2003.

2. NetBank has negative cash flow. Negative cash flow is common among growth firms, but it's still a warning sign.
3. NetBank's high sales growth rate is the result of high interest rate deposit and aggressive marketing.
4. NetBank has a low profit margin. Its five year average PM is negative. This is one of the reasons that investors have not shown great confidence in the company.
5. One of the reasons NetBank had low profit may be that the company has higher than average financial leverage, which leads to a higher interest burden.
6. Low profits led to lower rate of return, both ROE and ROC. Its ROC is negative. Comparing it to the industry average and the other two companies, ROC gives an alarming sign of inefficiency.
7. As an internet bank, NetBank should have lower than average operational costs. But the management efficiency ratios offer the opposite signal. Its income and revenue per employee are way below the industry average.

Based on NetBank's stock pattern, the company does not have outstanding performance as it has claimed it would be. Thus, having good strategic plans and knowing when to make announcements is crucial to NetBank's market capitalization.
